The proposed solar "farm" at the Cape Cod country club is not in the interests of the Cape community. It is not in the interest even of the greater environment. Well, it's true that there has been a measured 5 mg/L of nitrogen in the pond water. This is not a disaster such as the installation of 47 acres of solar panels would be the company sites a reduction of 238,000 tons of carbon dioxide over 30 years span, but this is specious reasoning. To what method of electricity generation making comparidon? ? They completely ignore the likelihood that emergent technologies will replace the heaviest polluters . The substitution of solar electric will make a negligible improvement in our atmosphere. Meanwhile, a resource would be destroyed that is vital to the local economy and of significant historical and architectural value. In a pitch pine tree over the first green at the Cape Cod country club a Guardian Eagle nests. It is a beautiful thing.
