Executive Summary

The Cape Cod Commission has completed 40 seasons in the ongoing Traffic Counting Program. The Cape Cod Commission adds new locations and updates existing ones each year. Over 1,450 different locations on Cape Cod have been counted at least once, and over 7,580 weekday counts have been performed since the program began. The Commission primarily conducts counts during the summer, which is the peak season for traffic volumes for the region. However, counts are also conducted in the off-peak seasons to help track changes. The result of the Traffic Counting Program is a useful database of traffic volume information for transportation planning.

In 2023, the Commission's Traffic Counting Program conducted 271 automatic traffic recorder (ATR) counts on Cape Cod. The one-year average annual growth rate (2022-2023) was calculated to be 0.58% for the entire region while the 10-year average annual growth rate (2014-2023) was calculated to be -1.23%. From 2014 to 2023 all four sub regions on Cape Cod showed negative growth. However, in the latest period, two of the four regions showed positive one-year growth (2022-2023), with the highest being the Mid Cape. Over a 10-year period (2014-2023), summer traffic Cape-wide has decreased an average of -1.28% per year. However, the past year (2022-2023) has seen an overall increase in Cape-wide summer traffic of 1.19%. It is important to note that the COVID-19 pandemic which peaked in the Summer of 2020, made a significant impact on traffic volumes observed in 2020 and 2021. Furthermore in 2022 and 2023, there was a decrease in the number of trips observed as the traffic began to shift back to pre-pandemic volumes. The pandemic is likely played a major factor in the negative 10-year growth calculations, and this data should be used with caution. Data obtained from the Massachusetts Department of Transportation's permanent counting stations are included in tables separate from the counts done by the Commission's program.

In addition to ATR counts, the Traffic Counting Program has completed over 1,300 turning movement counts (TMCs), over 600 park-and-ride lot observations, and over 100 bicycle and pedestrian studies. Additionally, year-round monthly data from the Commission's two remote counting stations (two in Harwich, one in Barnstable) provides a view of the seasonal traffic changes in the Mid- and Lower Cape sub-regions.

Local, state, and federal officials, engineers, transportation planners, and many other organizations and individuals use the traffic counting data. The information is used to perform traffic impact studies for new developments, analyze existing traffic demands on Cape Cod's roads, and identify ways to improve traffic flow and safety. The Commission expects to continue to expand and update this important database for transportation planning.

Acknowledgements

The Cape Cod Commission's transportation staff would like to thank the Federal Highway Administration, the Massachusetts Department of Transportation, and the County of Barnstable for providing funding and support for this important transportation planning activity.

Cape Cod Commission Project Team

Project Coordinator: Evan Costa, Transportation Planner
Project Coordinator: David Nolan, Senior Transportation Planner
Colleen Medeiros, Transportation Program Manager and Transportation Engineer
Anne Reynolds, GIS Director
Phil "Jay" Detjens, Applications Manager

The Cape Cod Commission's transportation staff would like to thank Colin Marczely, Nico Anderberg, and Carly McCarthy, the Cape Cod Commission's traffic counting technicians for Summer 2023.

The information presented on the maps and figures in this report is for planning purposes only. They are not adequate for legal boundary definition, regulatory interpretation, or parcel level analysis. They should not substitute for actual on-site surveys or supersede deed research.

Introduction

This report summarizes traffic counts conducted between 2014 and 2023 by the Cape Cod Commission. Traffic count locations are selected based on recommendations from the Massachusetts Department of Transportation (MassDOT), town officials, members of the Cape Cod Joint Transportation Committee, and the Cape Cod Commission transportation staff.

Since 1989, the Commission staff has used automatic traffic recorders (ATRs) to conduct traffic counts. ATR technology has advanced over the past decade to allow many different types of studies. The two most common forms of ATRs Commission staff utilize are the pneumatic roadway tubes and radar-based traffic recorders. The major difference between these counter methods is that the pneumatic road tube counters collect vehicle classification data in addition to volume and speed. The radar counters that Commission staff use only collect volume and speed. The collection of traffic volumes is the most frequent type of study conducted by the Commission, but vehicle speed and vehicle classification studies are conducted upon request from MassDOT or local officials.

Cape Cod's Traffic Counting Program began in 1984. Since the first count, the Commission staff has obtained 7,580 weekday counts at over 1,450 different locations. In 2023, Commission staff collected 271 ATR counts using traditional pneumatic roadway tubes to collect data as well as radar-based traffic recorders attached to utility poles along the roadway. Directional traffic volume counts were conducted at most of the locations where possible. Directional information is important when performing traffic studies because direction of travel can vary significantly by time of day. The Commission staff also fulfilled special requests such as vehicle speed and classification studies during the summer. The following table summarizes the activities of the Traffic Counting Program for the past 40 traffic counting seasons. Appendix A includes a summary of all ATR counts obtained in 2023.

Year	Weekday Counts	Weekend Counts	Total
1984	70	0	**70**
1985	75	0	**75**
1986	121	7	**128**

Table 1: CCC Traffic Counting Program Activity

Using The Traffic Counting Data

Appendix B contains all weekday traffic counts performed between 2014 and 2023. The traffic counts for each town are contained in individual data sets. At locations with directional volumes, the information is first provided for the total of both directions, with the directional volumes following below. Counts performed on numbered routes are listed first in numerical order. Subsequently, named streets are listed in alphabetical order.

TOWN

Traffic counts are grouped by the town in which the traffic count is located. The towns are sorted geographically, beginning with Bourne in the Upper Cape sub-region, and ending with Provincetown in the Outer Cape. A map of the town order is included in Appendix B to help navigate through the count data.

ROUTE/LOCATION INFORMATION

The roadway where the traffic count was taken is listed first for each count location. As part of the description, the orientation of the location with respect to the nearest cross street or notable geographic detail is also listed. For example, “Rt 3A S of Bour/Plym TL” is shorthand for “Route 3A, south of the Bourne/Plymouth town line.” Note that the counts performed on a town line are listed twice in the report. For each location at a town line, the count location is given under both town names. This allows the data to be analyzed more effectively. For a complete listing of abbreviated terms please refer to the Glossary of Abbreviations following the text of this report.

DATE OF STUDY: (YR), (BEGIN DATE), (END DATE)

Under each location, all available counts are listed in reverse chronological order, with the most recent appearing first. Year, Begin Date and End Date of a count are listed in the first three columns. Not all locations are counted every year, and some may be counted more than once each year. Generally, counts are conducted for a 48-hour period, although some cover longer periods. To monitor summer weekday traffic, most counts are conducted Monday through Friday during the summer season.

When comparing counts taken in different years, it is important to consider fluctuations in seasonal visitation to the area as well as year-to-year growth. For example, a July 2013 count will generally be higher than an April 2014 count, mainly because of the seasonal visitation differences. Even the comparison of a count performed in July 2013 to June 2014 could be misleading due to the increase in traffic experienced during the month of July. However, if a count conducted in April 2014 shows

an increase over a count performed in July 2013, for example, the effect may be a result of area growth. Seasonal adjustment factors can allow for a better comparison of data between different months. See Section 5 for a greater description of seasonal adjustment factors.

Another variable to consider when comparing counts is the day(s) of the week in which the counts were performed. Comparison of weekend counts can also be used for estimating growth. However, a comparison of a count performed over a weekend and a count obtained during the weekdays could be misleading. Therefore, when estimating annual growth in traffic in an area, it is best to compare counts taken at the same location at the same time of year and on the same type of days (weekday or weekend).

WEATHER CONDITIONS: (WEATHER)

Weather conditions may influence traffic volumes on Cape Cod. Cloudy days often contribute to increased traffic congestion except on beach access roads. On rainy or cloudy days, people engage in sightseeing or shopping rather than spending time at home or a favorite sunny-day location. In the data tables, brief descriptions of weather conditions during the count period are given. This information should be regarded with caution, as weather conditions may change considerably throughout a single day on Cape Cod. The Commission staff records the weather conditions of a count when setting down and picking up the traffic counting equipment. Of all the data provided in the tables, this category is the most subjective.

DIRECTION OF TRAVEL: (DIRECTION)

Direction identifies the direction of travel for the traffic on a roadway. Each traffic count is divided into three rows. The first row, "Total," lists the data for the sum of the two directions. The next two rows list the directional data, with the direction of travel for the row indicated by the Direction column. If the count was done on a one-way road, only data for the one direction are listed and are identical to the information listed in the Total column. If the traffic counter did not separate the counts into the directional movements, only the data for the summation of both directions are listed.

SPEED MPH: (85TH PERCENTILE TRAFFIC SPEED)

Speed limits are typically based on the 85th percentile traffic speed (the maximum speed at which 85% of the vehicles are traveling). The measured 85th percentile speed can be different than the existing speed limit because of factors such as changes in geometric roadway geometry and driver behavior. All new ATR devices can determine the speed of vehicle traffic. The Cape Cod Commission has begun to record this figure at the request of town, staff or MassDOT officials. The data are

presented for each direction of traffic. Practical uses of the data could include evaluating the speed limit and safety of the roadway. 85th percentile speed can be found in appendices A & B.

AVERAGE DAILY TRAFFIC: (AXLE ADJ. ADT)

Average Daily Traffic (ADT) is an estimate of the average number of vehicles over a 24-hour period. Many of the older counters recorded pairs of "axle hits," not vehicles. This meant that multiple-axle vehicles were counted as more than one vehicle (i.e., two 5-axle trucks were recorded as 5 vehicles). This method produced an estimated number of vehicles that was higher than the actual number. Axle correction factors are used to adjust, as necessary, the ATR data. See Axle Correction for a more detailed description of axle correction factors.

PEAK HOUR DATA: (DATE&DAY), (HOUR), (VOL)

The Peak Hour is the highest one-hour traffic volume observed during the period counted. Three columns offer data on the Peak Hour of a count. The date and day of the week (Date&Day) in which the peak occurred is listed first. The hour of the day (Hour) representing the Peak Hour is listed in the second column using 24-hour time (e.g., "16" means that the Peak Hour occurred beginning at 4:00 p.m. and ending at 5:00 p.m.). The Peak Hour Volume (Vol) is listed in the third and right-most column. Please be aware that the two-way Peak Hour volume may not be equal to the sum of the two directional Peak Hour volumes. Instead, it may represent the hour within the period counted when the sum of traffic in both directions was greatest. Starting in 2011, peak hour volumes for each direction of travel correspond to the peak hour combined travel. This is to conform to MassDOT reporting requirements. Axle correction factors were used as necessary. Please see Axle Correction for more information on axle correction factors.

Peak Hour information is significant for transportation planning. First, it indicates the highest traffic demands on a roadway. Second, it can show how close a roadway's use is to its capacity. For example, if counts taken in different years or during different months of the same year indicate a change in average daily traffic without a corresponding change in Peak Hour traffic, the roadway may be experiencing capacity constraints during peak times.

4:00-5:00 P.M. TRAFFIC: (FOUR~FIVE)

The "Four~Five" column indicates the average traffic volume recorded between 4:00-5:00 p.m. during the count period. As with the other categories of data, the 4:00-5:00 p.m. volume is given for the total of both directions first, and then for each corresponding direction. The two-way 4:00-5:00 p.m. average volume is equal to the sum of the two directional 4:00-5:00 p.m. average volumes. Axle correction factors were used as necessary. Please see Axle Correction for more information on axle correction factors.

The 4:00-5:00 p.m. volume has been included as an aid to transportation planners and engineers. In addition to these purposes, the 4:00-5:00 p.m. volume also provides useful information when compared to the Peak Hour volume for a particular location. For example, during the years 2004-2014, Cape-wide, the Peak Hour for the entire day generally fell between the hours of 4:00-5:00 p.m. (Rush Hour). The entire dataset supports this finding. It is still the case that the 4:00-5:00 p.m. volume is often the Peak Hour for the location.

ANNUAL AVERAGE DAILY TRAFFIC: (AADT)

The Annual Average Daily Traffic (AADT) is calculated by multiplying the ADT by a seasonal adjustment factor for the month of the count. MassDOT supplies these factors based on six permanent traffic-counting stations on Cape Cod. Note that this year-round AADT is only an estimate, based on seasonal changes in traffic volumes at these six locations. A description of the techniques used by MassDOT to develop the seasonal adjustment factors can be found in the MassDOT Data and Seasonal Adjustment Factors section.

Axle Correction

Standard volume counts by the Automatic Traffic Recorders (ATRs) record pairs of axle hits. The ATRs then divide the number of axles by two to estimate the volume of the road. This is called the "divide-by-two" method. However, not all vehicles have only two axles. Trucks, for example, can have from three to seven or more axles. A truck with three axles would be counted as 1.5 cars under the divide-by-two method. To obtain more accurate estimates, the data must be corrected to account for vehicles with multiple axles. To account for this, MassDOT publishes a series of "axle correction factors". The most recent correction factors can be found in Table 2. The appropriate factor for each count must be determined based on the year of the count, the road classification of the count location, and whether the count location is within an urban area. The adjustment factors from 2012 and 2013 are based on 2011 factors, as MassDOT did not supply monthly adjustment factors during those years. Additionally, the adjustment factors from 2020 are based on 2019 factors. The latest values provided by MassDOT are from 2023.

Classification and speed studies as well as volume counts performed by certain ATR models do not need to be axle corrected because they do not use the divide-by-two method. Instead, they record the actual number of vehicles traveling on a roadway. As a result, the counts included in the Appendices requiring axle correction have had the appropriate axle correction factor applied, while those counts not needing axle correction are unchanged.

MassDOT Permanent Traffic Counting Stations

MassDOT currently collects year-round traffic volumes from the following permanent traffic counting stations:

- Route 3 north of the Bourne/Plymouth town line
- Route 6 at the Sagamore Bridge
- Route 28 at the Bourne Bridge
- Route 28 in Barnstable, west of Old Post Road (Cotuit)
- Route 28 in Falmouth, south of Otis Rotary
- Route 28 in Yarmouth, east of Higgins Crowell Road

Table 3, found on the following page, presents the Annual Average Daily Traffic (AADT) and summer Average Daily Traffic (ADT) for the Bourne and Sagamore Bridges for the last twenty-five years. Please note that data is not available for all years. Traffic data as old as the year 1969 is available on the Commission's transportation counts webpage: https://www.capecodcommission.org/our-work/traffic-counts/

Source: MassDOT

As shown in Table 3, the total number of combined volumes on both bridges is slightly down in comparison to the previous years of 2020-2022. This may be contributed to the "return to work" as the shift from pandemic precautions have ended and more people have returned to in-person work. During the height of the pandemic in 2021, bridge crossings peaked both from a year-round and summer perspective as many people worked remotely on Cape Cod. It is important to note that on March 20, 2023, vehicle travel over the Sagamore Bridge was reduced from the current two lanes in each direction to a single 12-foot-wide lane in each direction. The lane restrictions were for maintenance work critical to maintaining the structural integrity of the Sagamore Bridge. Work included concrete and pavement repairs on the bridge roadway, repair of deteriorated steel supports, maintenance of bridge joints, repairs to the concrete abutment structures, and maintenance to the bridge lighting and drainage systems. Lane restrictions were in place 24 hours a day for 52 days until crews completed the project in May of 2023. These restrictions caused significant congestion on Route 3 and Route 6, as well as a sizable shift in the number of vehicles

traveling to Cape Cod using the Sagamore Bridge. Vehicles trying to avoid the lane restrictions and congestion utilized the Bourne Bridge instead during the maintenance period which is represented in the data with a small increase in year-round Bourne Bridge crossings and a small decrease in the number of year-round Sagamore Bridge crossings.

BRIDGE DATA THROUGH THE YEARS

Traffic data has been collected at permanent count stations at both bridges since 1972. Carrying roughly twice as many vehicles today as in 1972, the story of traffic over the bridges is the story of traffic on Cape Cod.

Figure 1 shows both summer and annual average daily traffic (ADT) over the bridges. Overall, there was an upward trend from the early 1970's through to the early 2000's, reaching a peak in 2002. Traffic volumes, on average, dropped from 2002 to 2008 before trending upward again starting in the early 2010s. The COVID-19 Pandemic in 2020 led to a major dip in ADT over both the Bourne and Sagamore Bridge as most of the country experienced lockdowns and or were placed in quarantine. In 2020, the ADT over the bridges was close to the same amount as in 1990 and 1991. The ADT in this location saw a new maximum in 2021, as travel restrictions due to COVID-19 began to be lifted. As of 2022, the ADT over the bridges has leveled out to the same ADT range as the early 2000s and the 2010s.

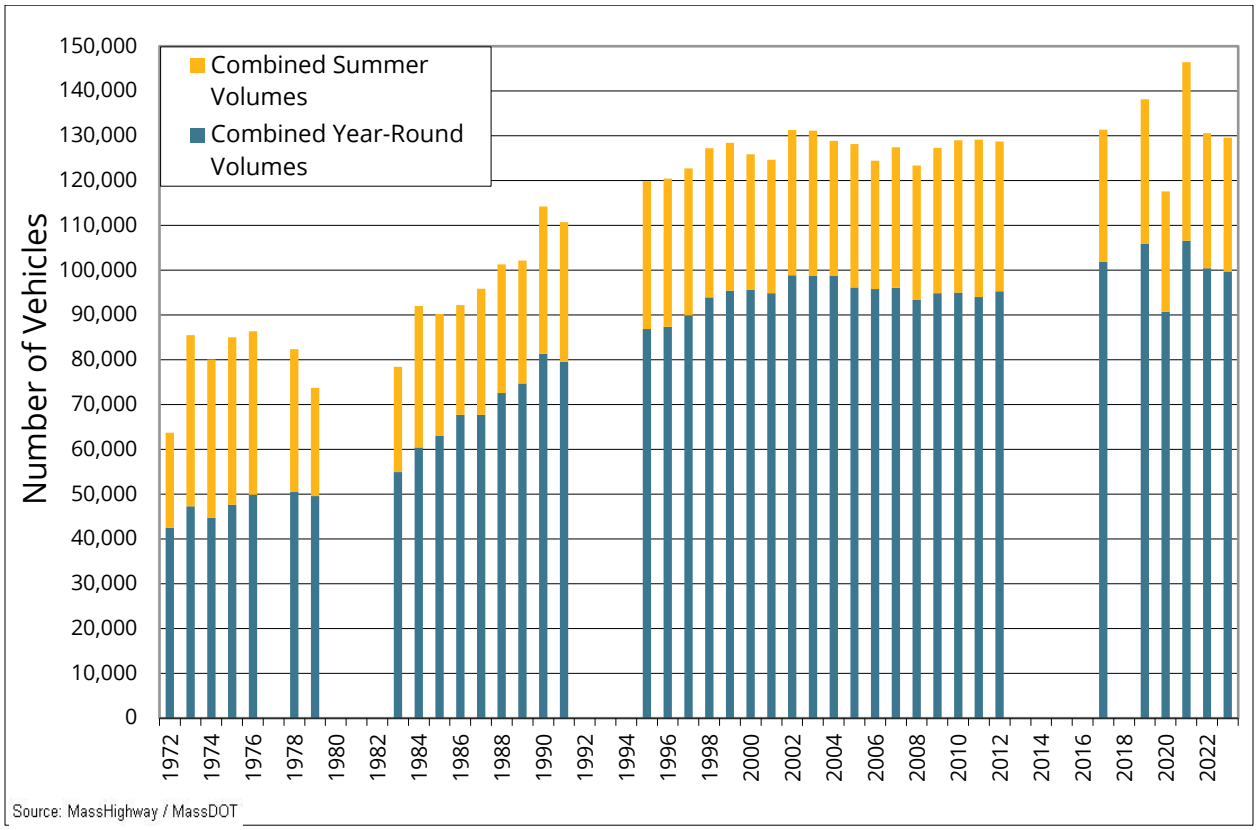

Figure 1: Combined Average Daily Traffic over Bourne and Sagamore Bridges

Seasonal traffic volumes over the bridges have also changed considerably over the years. Figure 2 shows the combined ADT per month over both bridges from a variety of decades. In just the past decade alone, ADT has nearly doubled for every month when compared to ADT from 1972. ADT has continued to rise into the 2020s. Despite the increase, trends have remained similar; peak season months receive higher ADT than non-peak season months. Data for 2011 and 2018 are displayed alongside the data from the latest peak year in 2021 and the latest data from 2023 to show the traffic volume comparison over the latest decade.

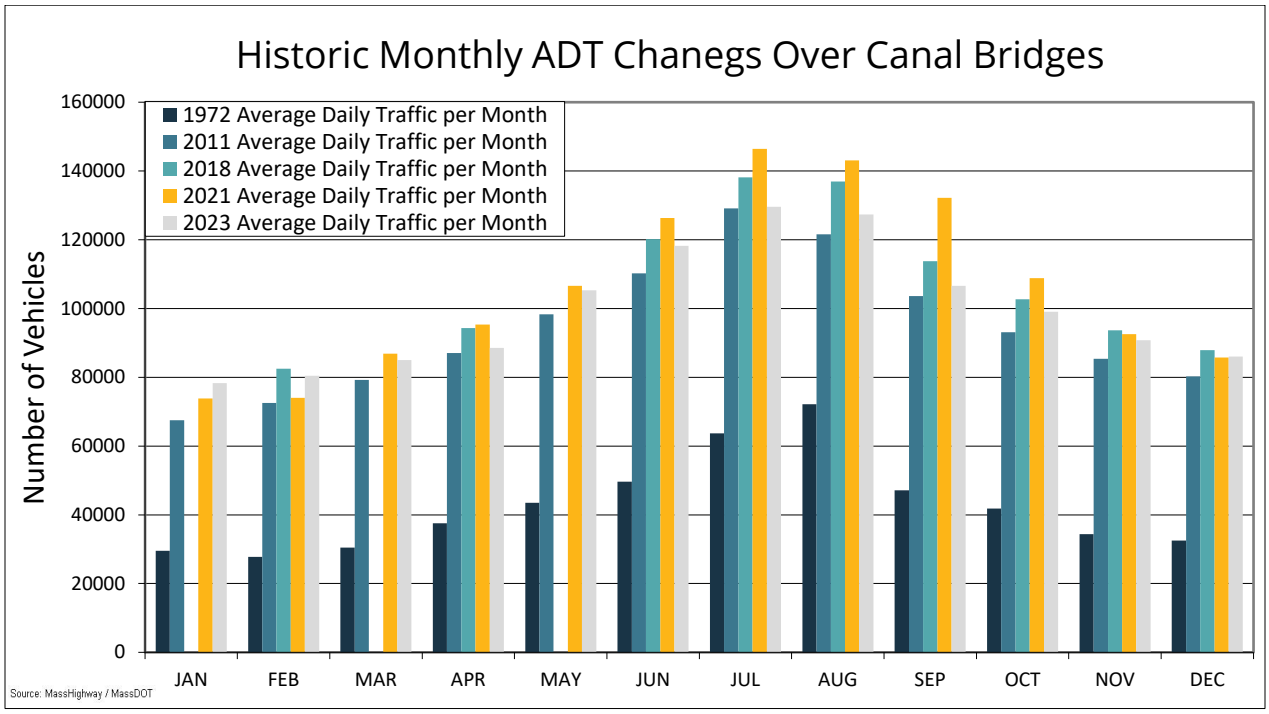

Figure 2: Historic Monthly ADT Changes at the Bourne and Sagamore Bridges

BRIDGE DATA DURING COVID-19

Traffic patterns in Barnstable County reflect the ebb and flow of the region's seasonal and tourism-driven economy, which brings a surge of visitors in the peak summer months and on weekends. In 2020, the COVID-19 pandemic disrupted the typical traffic trends. Following mass business closures and social distancing measures implemented in March 2020, traffic volumes over the Bourne and Sagamore bridges dropped significantly, with downward trends continuing throughout April. In May 2020, traffic numbers, while still lower than usual, began to rebound. Traffic over both bridges was still down by 31% in May 2020 as compared to the year prior and down by 13% in June 2020. Numbers continued to return to normal levels throughout the 2020 summer season. In 2021, traffic exceeded pre-pandemic levels over both canal bridges in the summer and fall months. By 2022 and continuing into 2023, traffic volumes over both bridges had decreased to similar levels and trends observed before the pandemic.

Table 4 presents the AADT and summer ADT for the other MassDOT permanent traffic counting stations for the last twenty-five years. The summer ADT for a particular year represents the July ADT of that year. If no traffic volumes for July were available, then the August ADT was used instead. Please note that data at certain locations is not available for every year.

Seasonal Adjustment Factors

Observed traffic volumes at a given location can often vary from month to month. This is especially true on Cape Cod, where summer traffic volumes are higher due to seasonal tourism. To compare traffic volume data collected in different months, seasonal adjustment factors must be applied.

ADJUSTMENT FACTOR USAGE

Using the data collected from MassDOT's permanent traffic counting stations, MassDOT determines the seasonal adjustment factors for the next year. These factors indicate relative traffic volumes throughout the year. For example, weekday traffic in January is approximately half the weekday traffic in July. By multiplying by the Average Daily Traffic (ADT) of a traffic count by a seasonal adjustment factor, an estimate of annual ADT can be produced for that location. ADT volumes from all months can in this way be converted into annual ADT volumes and properly compared. The newest values for the region provided by MassDOT are from 2023, which, as well as the factors from previous years can be found in Table 5.

Table 5: Monthly Adjustment Factors for Cape Cod

Source: MassDOT

**2011 values used; **2019 values used*

The seasonal adjustment factors only produce an estimate of annual ADT for several reasons. First, there are some gaps in the reporting of seasonal adjustment factors for the region. The seasonal adjustment factors from 2012 through 2015 are based on 2011 factors, since MassDOT had not supplied monthly adjustment factors since 2011. Additionally, the adjustment factors from 2020 are based on 2019 factors as MassDOT. Second, the permanent stations are located on state highways. Seasonal traffic fluctuations may be different on local roadways and streets. Third, none of the permanent stations are located east of Yarmouth. This is significant because seasonal traffic fluctuations are generally greater in areas with higher seasonal population changes, such as the Outer Cape.

Cape Cod Commission Remote Counting Stations

In addition to MassDOT permanent count stations, continuous, year-round data is collected at Cape Cod Commission remote count locations. At each of these locations, vehicle counts are recorded hourly for each approaching lane of the intersection. The first remote count location, Route 137 at Route 39 in Harwich, became operational in 2010, however, as of 2020, this count station location has stopped reporting data. A second location in Harwich, Route 124 at Queen Anne Road, became operational in July of 2012. The third remote count location on Route 28 at Lumbert Mill Road in Barnstable became operational in January 2013. The average year-round monthly and average summer monthly total entering vehicles are shown for these locations in Table 6 for the past ten years. The average summer month data is from the peak months of July and August.

Table 6: CCC Remote Count Locations

	Harwich Rt 137 @ Rt 39 (2548)		Harwich Rt 124 @ Queen Anne Rd (2570)		Barnstable Rt 28 E of Lumbert Mill Rd (2897)

2014		21,351		24,224		24,737

**Summer data is missing one or more months*

The following figure, Figure 3, shows the average monthly volumes that were counted by Cape Cod Commission permanent counting stations in 2023. The intersection at Route 28 and Lumbert Mill Road in Barnstable showed the highest volumes of these two locations every month besides July.

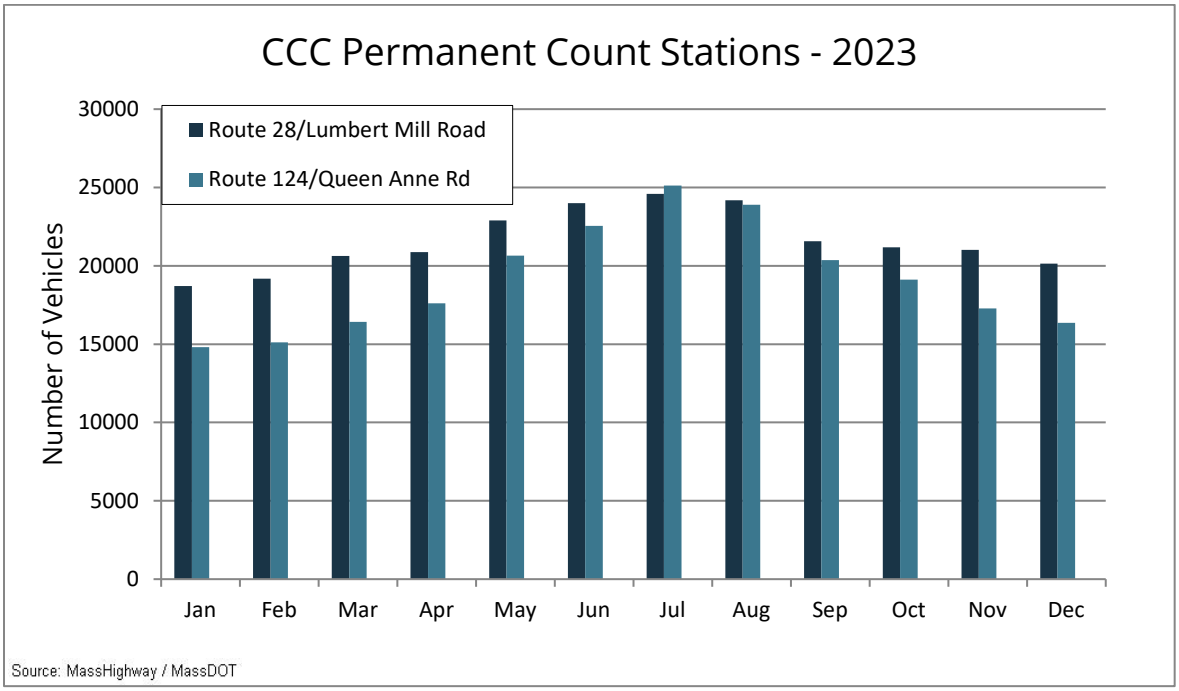

Figure 3: Cape Cod Commission Permanent Counter Data - 2023

Between the two, Route 124 at Queen Anne Road, showed a large increase in volume during the summer months, while Route 28 and Lumbert Mill Road showed more consistent volumes year-round. These counters are helpful when looking at volume changes and growth across the region.

Results and Analysis

After seeing sustained growth for the second half of 20th century, traffic patterns on Cape Cod have been less consistent early in the 21st century. Over the last ten years (2014-2023), there has been an overall decrease in Cape-wide traffic. The current 10-year annual average growth rate for all roads Cape-wide is -1.23%, which includes traffic volume shifts related to the Covid-19 pandemic.

MASSDOT PERMANENT COUNTING STATIONS AND BRIDGE CROSSINGS

MassDOT's permanent counting stations can be used to show a trend in road usage over time. As can be seen in Table 7, traffic volumes over the MassDOT permanent count stations have had minimal change over the last ten years, with a 10-year average annual growth rate (2014-2023) of 0.13%. While in the past year alone the one-year growth rate (2022-2023) has seen an increase of 1.16% over all MassDOT stations. Route 3 north of the Bourne/Plymouth town line has seen a 10-year average annual growth of 0.63%. The Sagamore Bridge has seen a 10-year average annual growth of 0.87%, while the Bourne Bridge has seen a negative growth of -0.61%. Due to equipment issues, not all stations were available for analysis.

Table 7: Summer Growth Rates – Permanent Counting Stations and Bridge Crossings (%)

Permanent Traffic Counting Station	10-Year Average Annual Growth Rate (2014-2023)	One Year Growth Rate (2022-2023)
#20: Rt 3 N of Bourne TL	0.63%	0.11%
#707: Bourne Bridge	-0.61%	1.99%
#708: Sagamore Bridge	0.87%	-2.72%
#709: Rt 28 E of Higgins Crowell*	0.60%	1.40%
#7322: Rt 28 S of Otis Rotary**	n/a	4.27%
#7351: Rt 28 W of Old Post Rd	-0.83%	1.90%
All MassDOT Stations* **	0.13%	1.16%

**Site #709 data has been grown by MassDOT since 2015*
***Site #7322 lacks a recent complete ten-year period of data*
****Average does not include n/a (due to incomplete data)*

With the Bourne and Sagamore Bridges providing the primary access to and from Cape Cod, observing traffic trends at these stations can provide useful insight into annual and seasonal traffic trends. Annually, more than 35 million vehicles cross the two bridges. Translating to about 18 million vehicles cross the Sagamore Bridge, and about 17 million vehicles cross the Bourne Bridge.

CAPE-WIDE TRAFFIC GROWTH

Traffic volumes on Cape Cod have changed drastically over the past several decades. Figure 4 shows the 10-year average annual growth rates over the past thirty years of data collection on Cape Cod. This figure has been updated using an improved methodology as compared to previous traffic counting reports. Beginning with the 10-year average from 1994 to 2003, there was a period of negative growth happening between the ten-year periods until 2000 to 2009. After this period, growth gradually increased from 2001-2010 to 2010-2019. Since the COVID-19 pandemic, 10-year average annual growth rates have trended negatively again. However, the most recent period of 2014 to 2023 shows a less sharp decline suggesting that a positive trend could be expected.

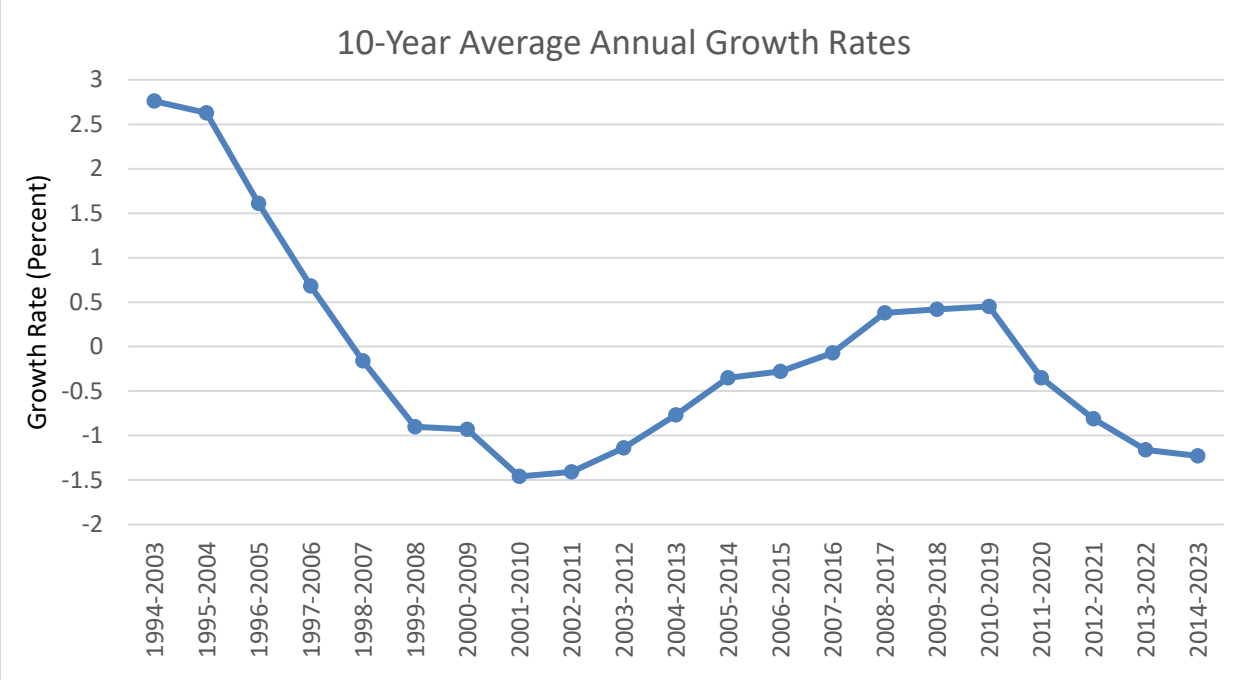

Figure 4: 10-Year Average Annual Growth Rates

The following table, Table 8, shows the most recent growth rates for the various sub-regions of Cape Cod over a 10-year period. The data used for these growth rates is year-round data. The 10-year average annual growth rate between 2014 and 2023 is -1.20% for all of Cape Cod. From 2014 to 2023 all four sub-regions on Cape Cod showed negative growth for a 10-year average annual growth rate. Two of the four subregions experienced a positive one-year growth. In recent years, there has been monthly radar data collected at three points along the Outer Cape corridor; Route 6 North of Springbrook Road, Route 6 at Wellfleet/Truro Townline, and Route 6 at Truro/Provincetown Townline. This supplemental data is incorporated in the calculation of the local growth percentage factors along with the other Outer Cape counts, to provide more accurate growth data in this part of

the region. Figure 5 shows the subregional and regional values for the corresponding 10-year average annual growth rates.

Table 8: Cape Cod Traffic Growth by Subregion

Region*	Number of Comparisons**	10-Year Average Annual Growth Rate (2014-2023)	One-Year Growth Rate (2022-2023)
Upper Cape	83	-0.93%	-7.37%
Mid-Cape	81	-1.48%	7.00%
Lower Cape	61	-0.71%	-0.67%
Outer Cape	30	-2.50%	5.46%
All Roads	**255**	**-1.23%**	**0.58%**

**Upper = Bourne, Sandwich, Falmouth, Mashpee | Mid = Barnstable, Yarmouth, Dennis | Lower = Harwich, Chatham, Brewster, Orleans | Outer = Eastham, Wellfleet, Truro, Provincetown*
***Corresponds to ten-year analysis only*

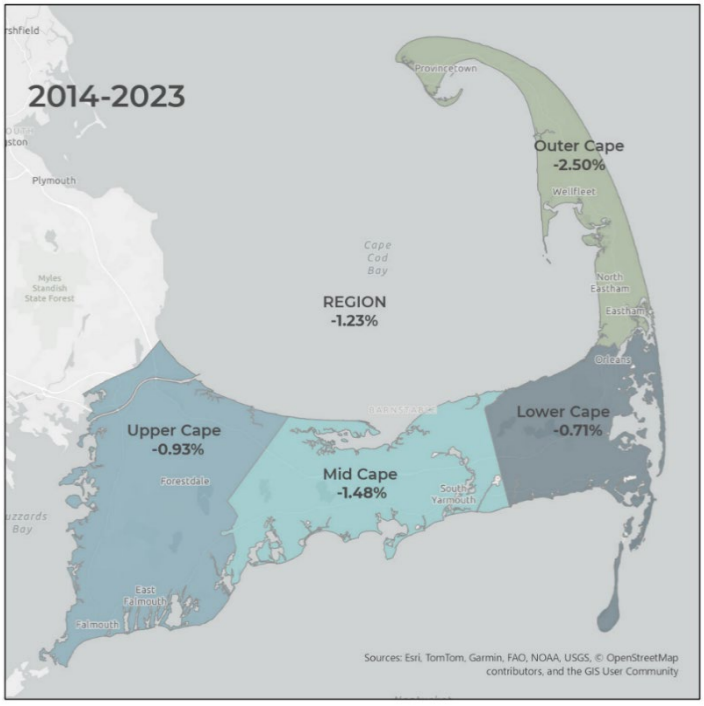

Figure 5: Regional and Subregional 10-year Average Annual Growth Rate (%)

Regarding the slight decline regional in traffic volume from 2014 to 2023 across the Cape, one of the major contributors of this decline could be the Covid-19 Pandemic. The Covid-19 Pandemic had a

significant impact on the decline of traffic volume in 2020 and into 2021, which would in turn lead to an overall decrease in the 10-year annual average growth. It is interesting to note that traffic volumes did come back to relatively normal pre-pandemic levels in 2022 after exceeding normal volumes in 2021.

The Covid-19 pandemic caused severe social and economic disruption around the world as well as locally on Cape Cod. Public areas, educational institutions, and businesses were either partially or fully closed in many jurisdictions, and many events were cancelled or postponed during 2020 and again in 2021. Telework also became a much more common form of work during the pandemic, which further reduced trips to places of work. The Cape-wide population has shown a moderate increase during this period (Table 9), which could help to explain why trip generators (commercial establishments, residences, etc.) have not been reduced by more.

Traffic surged during the Summer and Fall of 2021 due to changes on travel restrictions, social distancing measures, and public areas opening back up after mass closure. The public began to travel again, and this created a visible increase in traffic during the latter half of 2021. Traffic volumes collected during 2022 saw a dip in one-year average growth rate region wide as volumes began to return to levels observed pre-pandemic. Traffic volumes have continued to return to pre-pandemic levels in 2023, with a positive 0.58% growth increase from 2022 to 2023. As traffic volumes begin to show growth post-pandemic, it will continue to be important to monitor the impacts to traffic volumes, congestion, and transportation modes region wide.

Appendices

The appendices contain traffic count data collected from 2014-2023. Appendix A includes a summary of all ATR counts obtained in 2023. Appendix B makes up the majority of the Traffic Counting Report, it includes all Automatic Traffic Recorder (ATR) counts obtained from 2014 to 2023, arranged geographically by town (starting in the Upper Cape area at Bourne and ending in the Outer Cape area at Provincetown). Appendix C is a collection of turning movement counts performed at Cape Cod intersections from 2014 to 2023. Appendix D summarizes bicycle pedestrian counts. Appendix E is a summary of park and ride lot capacity counts.

APPENDIX A: 2023 ATR COUNTS

Current Year Counts

APPENDIX C: 2014-2023 TURNING MOVEMENT COUNTS

The Cape Cod Commission (and its predecessor, the Cape Cod Planning & Economic Development Commission) has collected and maintained a database of turning movement counts from Cape Cod intersections since 1988. The database includes well over 1,000 observations. This report includes counts collected from the period 2014-2023. Traffic data over three years old are generally considered out-of-date as an input to traffic analyses but are included in this appendix as an aid to generating historic trends. This data is being provided for comparison purposes at intersections that have been counted more than once during the ten-year period and for consistency with the data available in the main text of the Cape Cod Traffic Counting Report. The following are descriptions of the items included in this appendix:

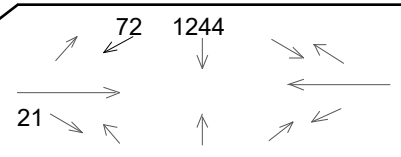

- Town: listed in contiguous geographic order used in main report (e.g., Bourne to Provincetown).
- Major Road Name "E-W" or "N-S" @ Minor Road Name: shows general direction of travel of the major road. The direction north is considered up on the turning movement diagrams.
- Site Code: a 4-digit identification number, unique to each intersection.
- Date/Time of Study: includes beginning and ending times for observations (24-hour format).
- Observed Peak Hour: the beginning time (24-hour format) of the busiest 60-minute period within the Observation period.
- Report Hour: for most observations, this is the period from 4 pm to 5 pm (listed as "16:00"). 16:00 has been identified to be the general "peak hour" for Cape Cod. If the observation period did not include this 60-minute period, a different Report Hour is indicated. For weekday morning counts, 8:00 am is identified as the Report Hour.
- Total Entering Volume: the total number of vehicles entering the intersection during the Report Hour.
- Diagrams of Traffic Volumes: These figures show the total number of vehicles for each turning movement during the Report Hour. In some cases, "Partial Data" may be indicated if certain approaches/movements were not observed. Use diagrams with caution.

Cape Cod Commission Turning Movement Counts

Bourne — Rt 28 N-S @ Jonathan Bourne Dr

Site Code	Date/Time of Study	Observed Peak Hour
3858	Mon 3/24/14 8:00 - 9:00	8:00

APPENDIX D: 2014-2023 BICYCLE/PEDESTRIAN COUNTS

The Cape Cod Commission's Summer Traffic Counting Program performs bicycle and pedestrian counts at various multi-use path locations on Cape Cod as well as at numerous intersections while recording turning movements. The data presented in this appendix include detailed data collected at Multi-Use Paths and simpler summary data collected at intersections. These data types are discussed below.

Multi-Use Path Data

Data collection techniques follow a uniform method used throughout the state, which includes distinguishing six specific categories of multi-use path users. Each location is identified by a site code, listed on the data sheet as "BPSite#." All counts differentiate directional data using a two-letter abbreviation (EB = Eastbound, WB = Westbound, NB = Northbound, SB = Southbound). For user categories where helmets are applicable, calculations present the percentage of users wearing a helmet. Boxes with blank values do not have applicable data. The following descriptions explain the types of multi-use path users identified during the counts:

- Bicyclists: These data include all users operating or contributing to the operation of a bicycle. A tandem bicycle operated by two people is counted as two bicyclists. A child being towed in a carrier is not considered a bicyclist. Some counts distinguish the number of helmeted bikers versus non-helmeted bikers.
- Skaters: Skaters are roller-skaters or in-line skaters.
- Walkers: This category includes all users walking on the multi-use path. This category may include people pushing a baby carriage or walking a pet (pets are not included in the count).
- Joggers: This category includes all users jogging and running along the multi-use path.
- Child in Carrier: This category refers to many different users. A Child in Carrier could be a child being pushed in a baby carriage, a child towed behind a bicycle in a carrier, or a child in a seat mounted to another bicycle (not a trailer).

Data is sorted by facility name. Please refer to the following data to better understand user classification.

Intersection Data

Cape Cod Commission staff perform a varying number of turning movement counts manually each year at intersections throughout Barnstable County. Observations are recorded typically starting at 4 p.m. and last for one and a half hours to two hours. The data summarized in the appendix includes the following information:

- Site Code: unique identifier number for each intersection
- Date/Time of Study: shows day of week, date, and range of times when the data were collected.
- Bicycles Observed during Study Period
- Pedestrians Observed during Study Period
- Estimated bikes/day: this is a calculated value obtained by multiplying the hourly average number of bicyclists by 10.
- Estimated pedestrians/day: this is a calculated value obtained by multiplying the hourly average number of pedestrians by 10.

The data are grouped by town beginning with Bourne on the Upper Cape extending to Provincetown in the Outer Cape. Within each town the data are sorted alphabetically by major road.

APPENDIX E: PARK AND RIDE LOT COUNTS

Cape Cod Commission transportation staff and technicians perform occupancy counts at the following three Park and Ride locations:

- Barnstable Park & Ride located near Exit 68 at 2186 MA-132, West Barnstable, MA 02668
- Sagamore (Bourne) Park & Ride at 2 Canal Road, Sagamore Beach, MA 02562
- Harwich Park & Ride located near Exit 82 at 302 Pleasant Lake Ave, Harwich, MA 02645

The number of parked cars is counted monthly, and the number of illegally parked cars is also noted. In the Park and Ride reports on the following pages, the number of cars observed is compared to the lot's overall capacity resulting in a calculated percentage of used capacity for the parking lot. The records in the database are grouped by lot then arranged from the oldest to most recent during the period 2014-2023.
